248-887-4173

Our precast concrete tunnel systems are a perfect example of versatility.

We manufacture standard size tunnels in eight different widths: 18", 30", 36", 42", 48", 60", 72" and 84".

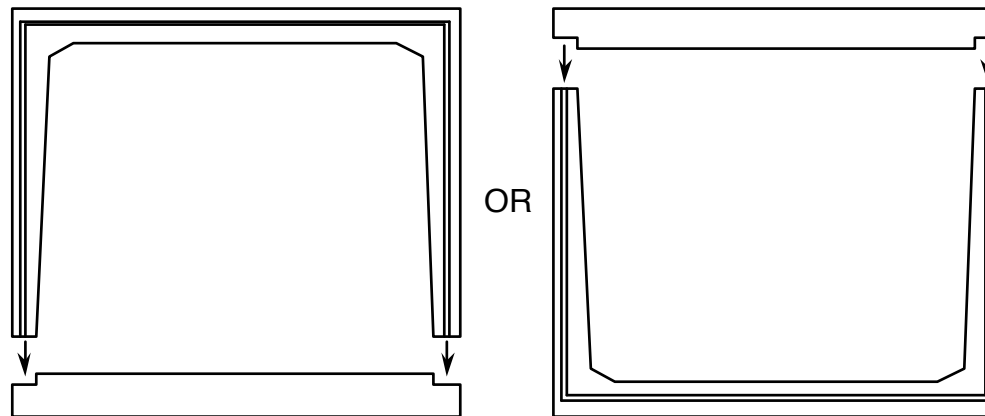

We can also quote custom size tunnels if these do not fit your requirements. Tunnel sections can be up to twenty feet long and may either have a "butt joint connection" or a "tongue-in-groove" connection as detailed below:

**Top View of Tunnel Joint**

Weld plates can be embedded on any surface of the tunnel for your use and inserts for racking, or unistrut, can also be included.

The tunnel can be set with the separate slab on the base as a "floor" or on top of the tunnel section as a "roof". Access openings can be formed during production.

Bends, turns, intersections, and expansion loops may be options for some tunnel sizes.

Our precast concrete tunnels are usually manufactured using Grade 60 Rebar Reinforcement and are designed for traffic loading conditions, but we can quote with composite rebar as an option. Thicknesses vary according to jobsite requirements.
